

# Food Safety and soil quality

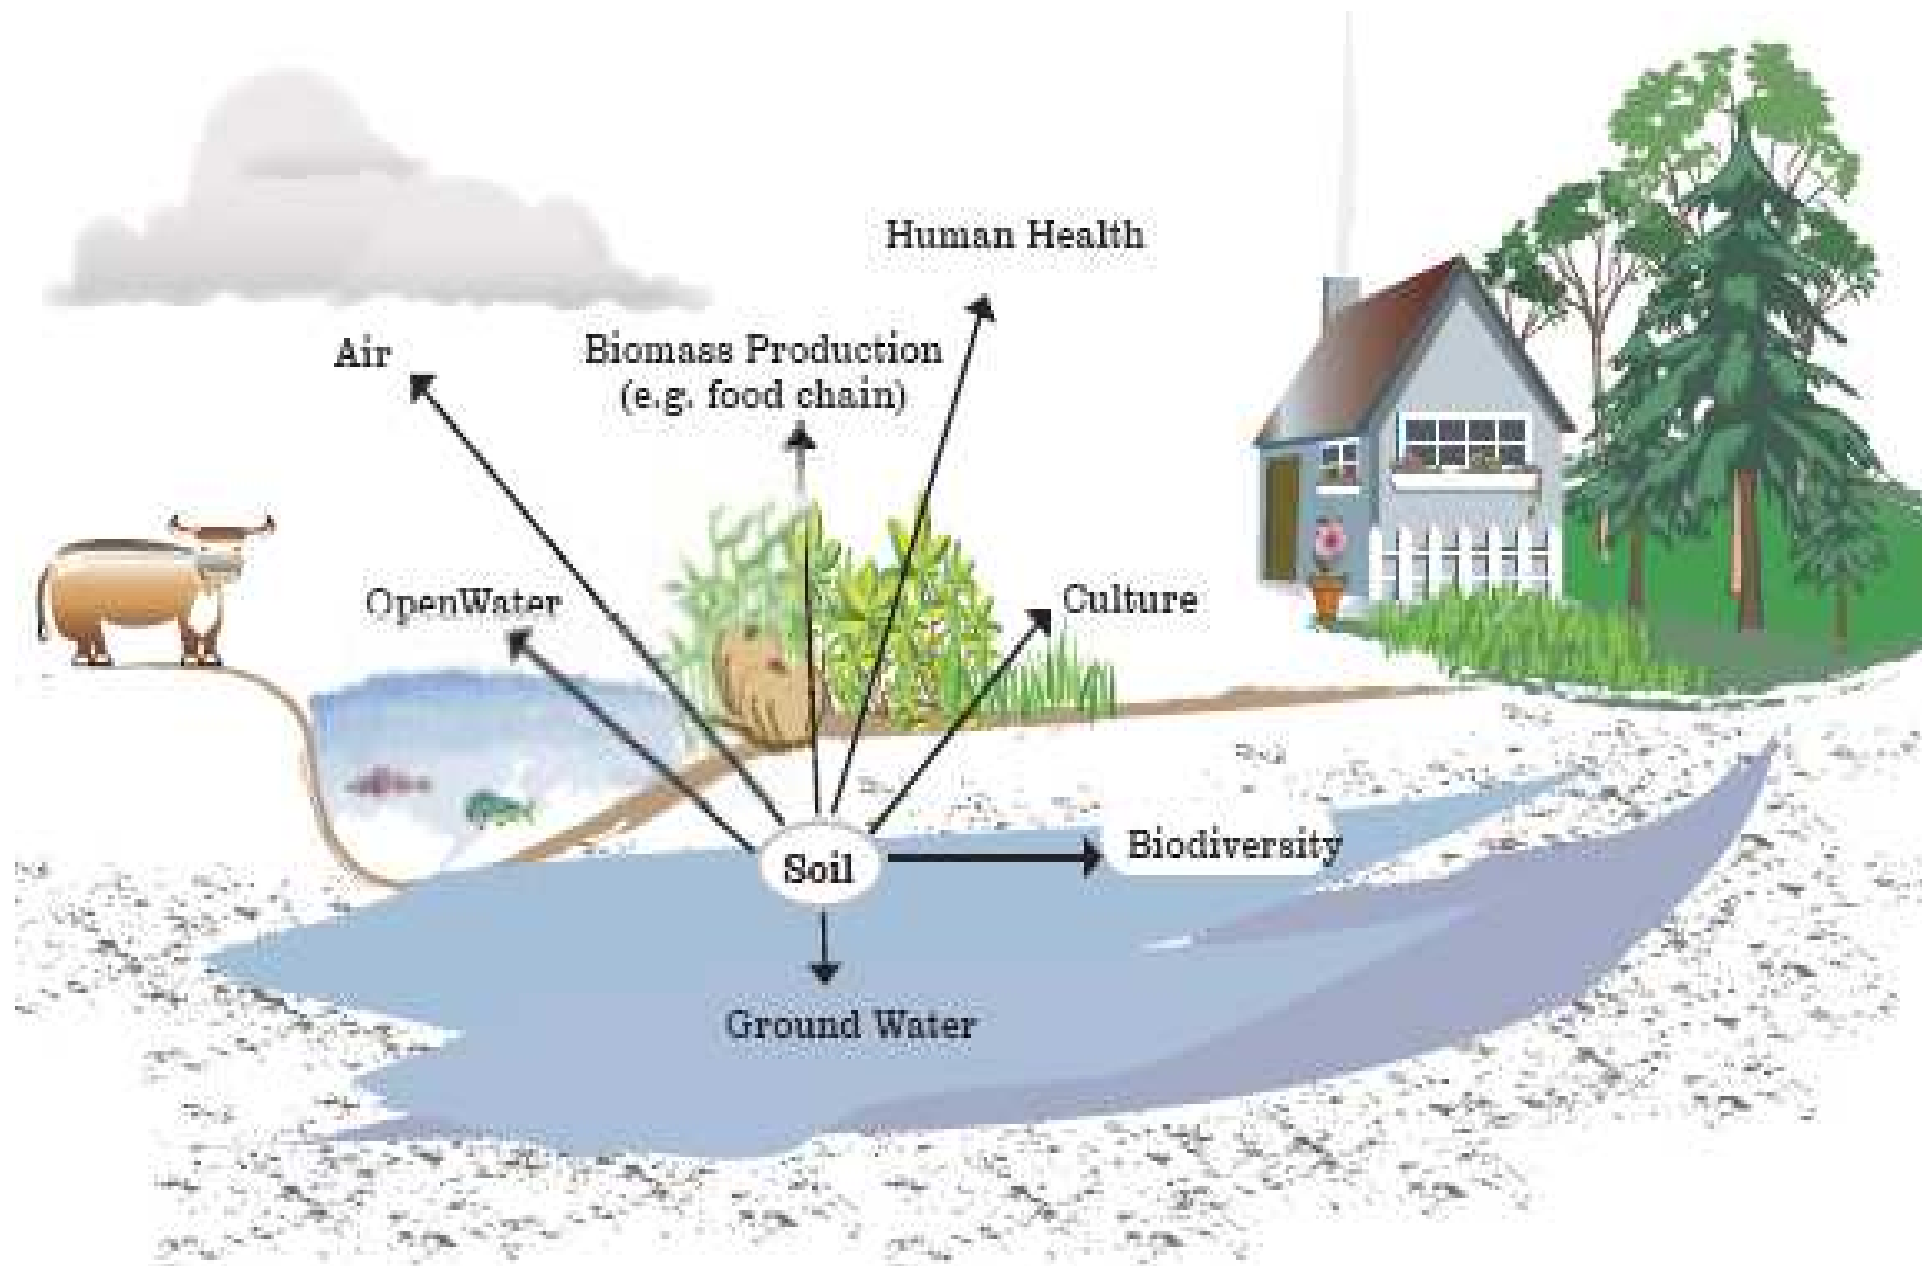

## Conceptual framework and examples

Bert-Jan Groenenberg Paul Römken  
Alterra – Wageningen UR

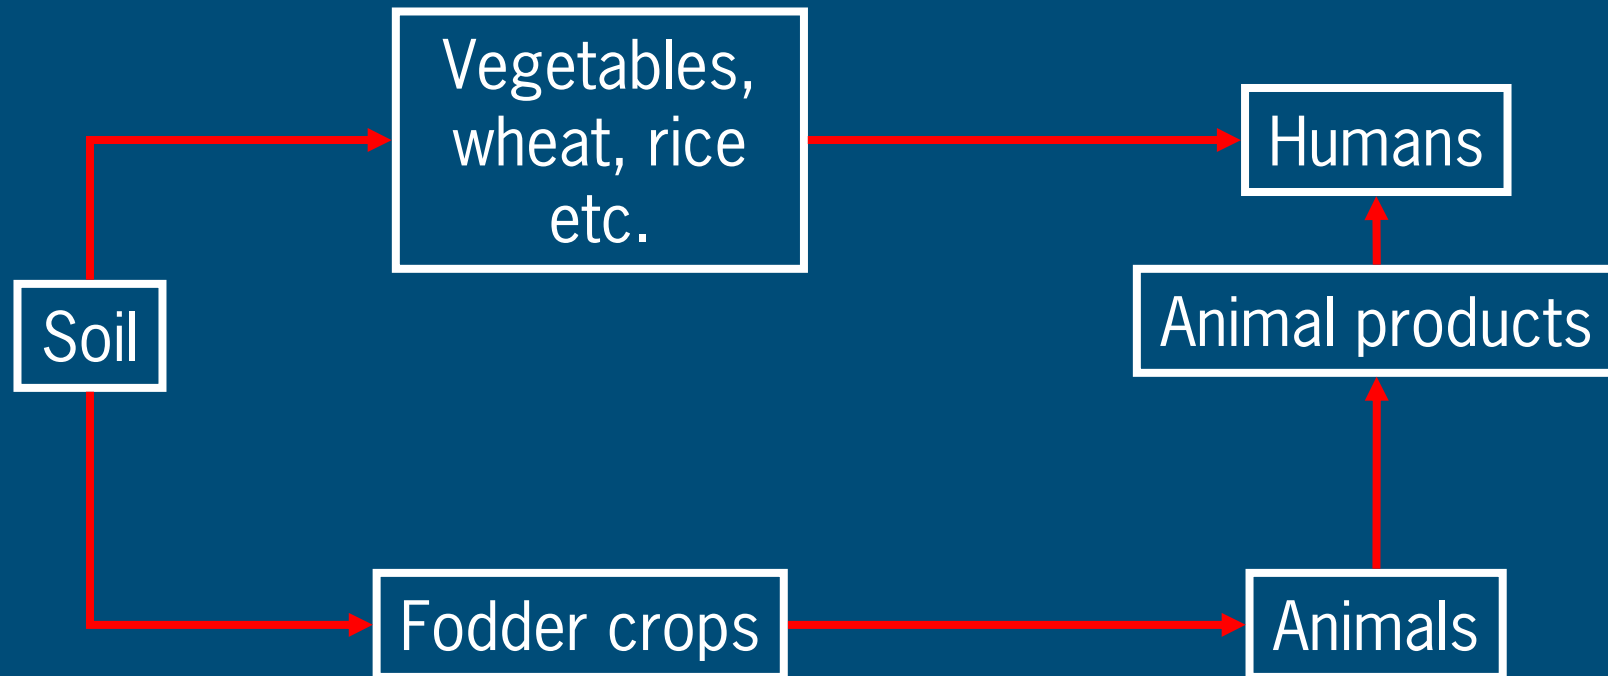

# Outline

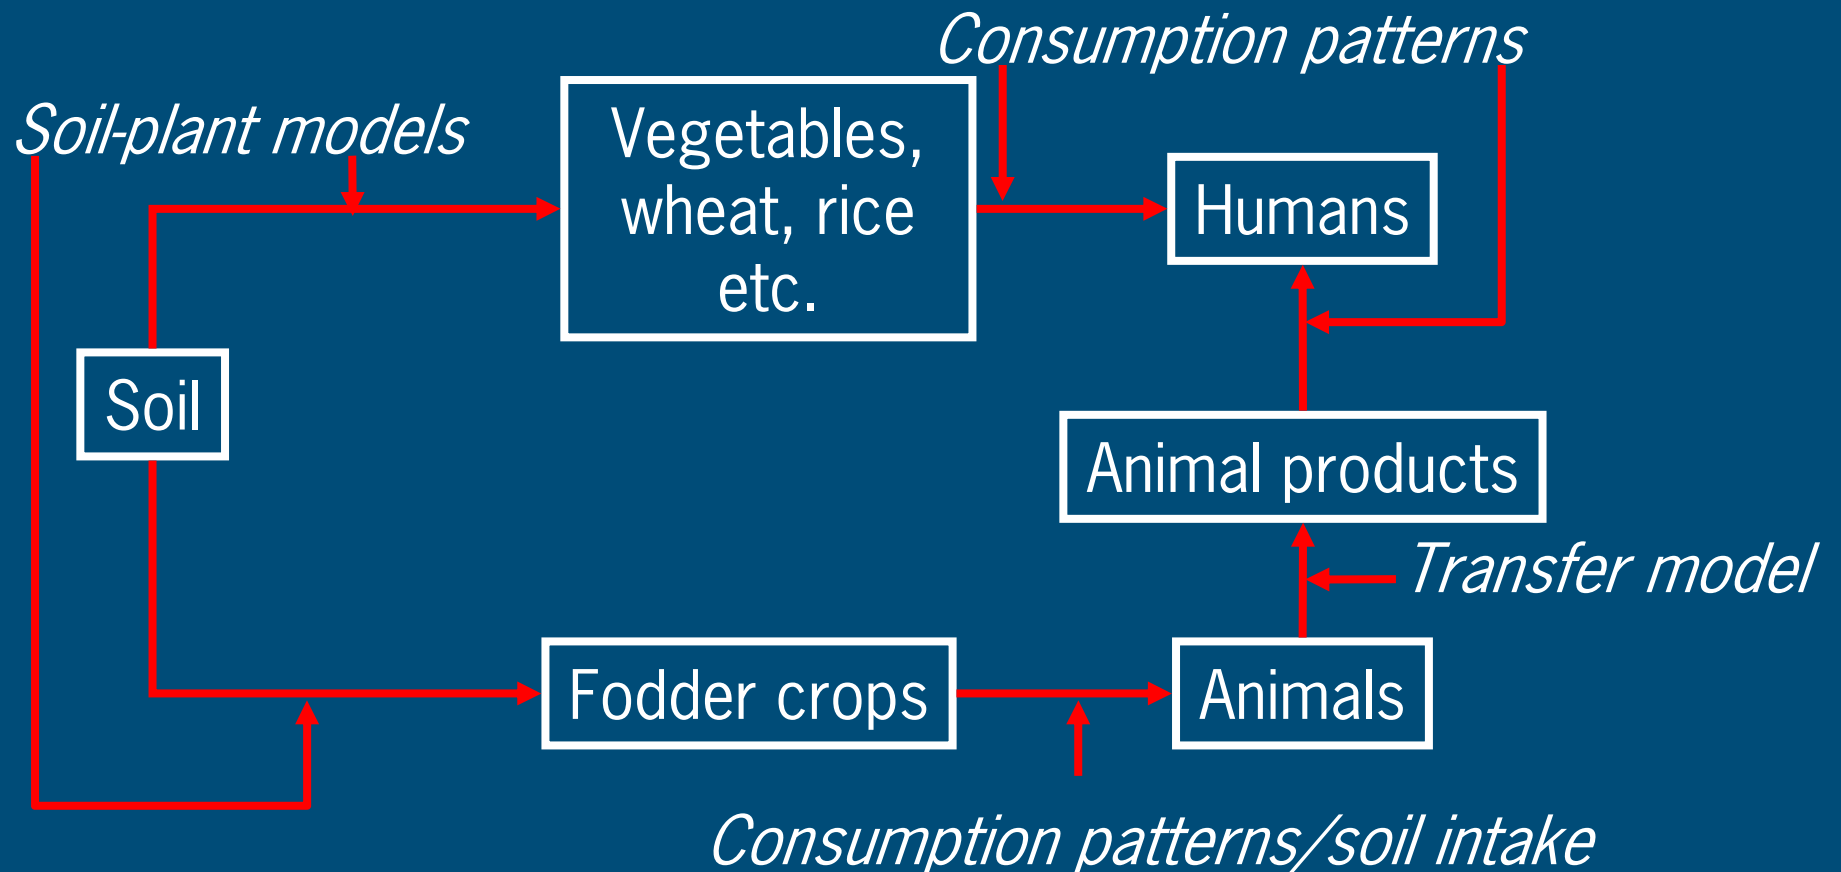

- Conceptual framework and soil standards for agriculture in Dutch legislation
- Case study Kempen area (Netherlands and Belgium)
- Scenario studies for the Netherlands

# Food safety and soil quality: the concept

# Food safety and soil quality: tools

# Soil policy in NL: management versus cleanup

- One framework but two legal instruments

## Standards for soil quality (and aquatic sediments)

Decree on soil Quality & Regulation  
(Besluit Bodemkwaliteit)

- Resuse of soil/dredging
- Maintain suitability of land
- Generic versus local standards

Decree on soil remediation

- Setting standards for clean-up
- Based on unacceptable risks
- National standards only

Tools-concepts!

# Soil standards for Agriculture

- Back calculation from relevant criteria to protect human and animal health (e.g. critical levels in food) to critical levels in soil taking into account:
  - Bio-availability
  - Differentiation between crops / land use (grass land / arable land)
  - Chain analysis (soil inputs) -> soil -> plant -> animal -> human

# Standards for Agriculture: what to protect?

## ■ Relevant criteria for protection

- Fodder quality (for Cd = 1 ppm at 12% moisture)
- Health criteria cattle (critical levels in kidney and liver)
- Food quality criteria animal products
- Food quality criteria for arable crops (vegetables, rice etc.) and animal products (meat, milk etc.)
- TDI for human beings (0.5 for Cd and 3.6 for Pb)

soil plant  
relation

$$\log(\text{Cd-plant}) = \text{int} + a * \text{pH} + b * 10 \log[\text{SOM}] + c * 10 \log[\text{Cd-soil}]$$

Chain model  
Soil - animal

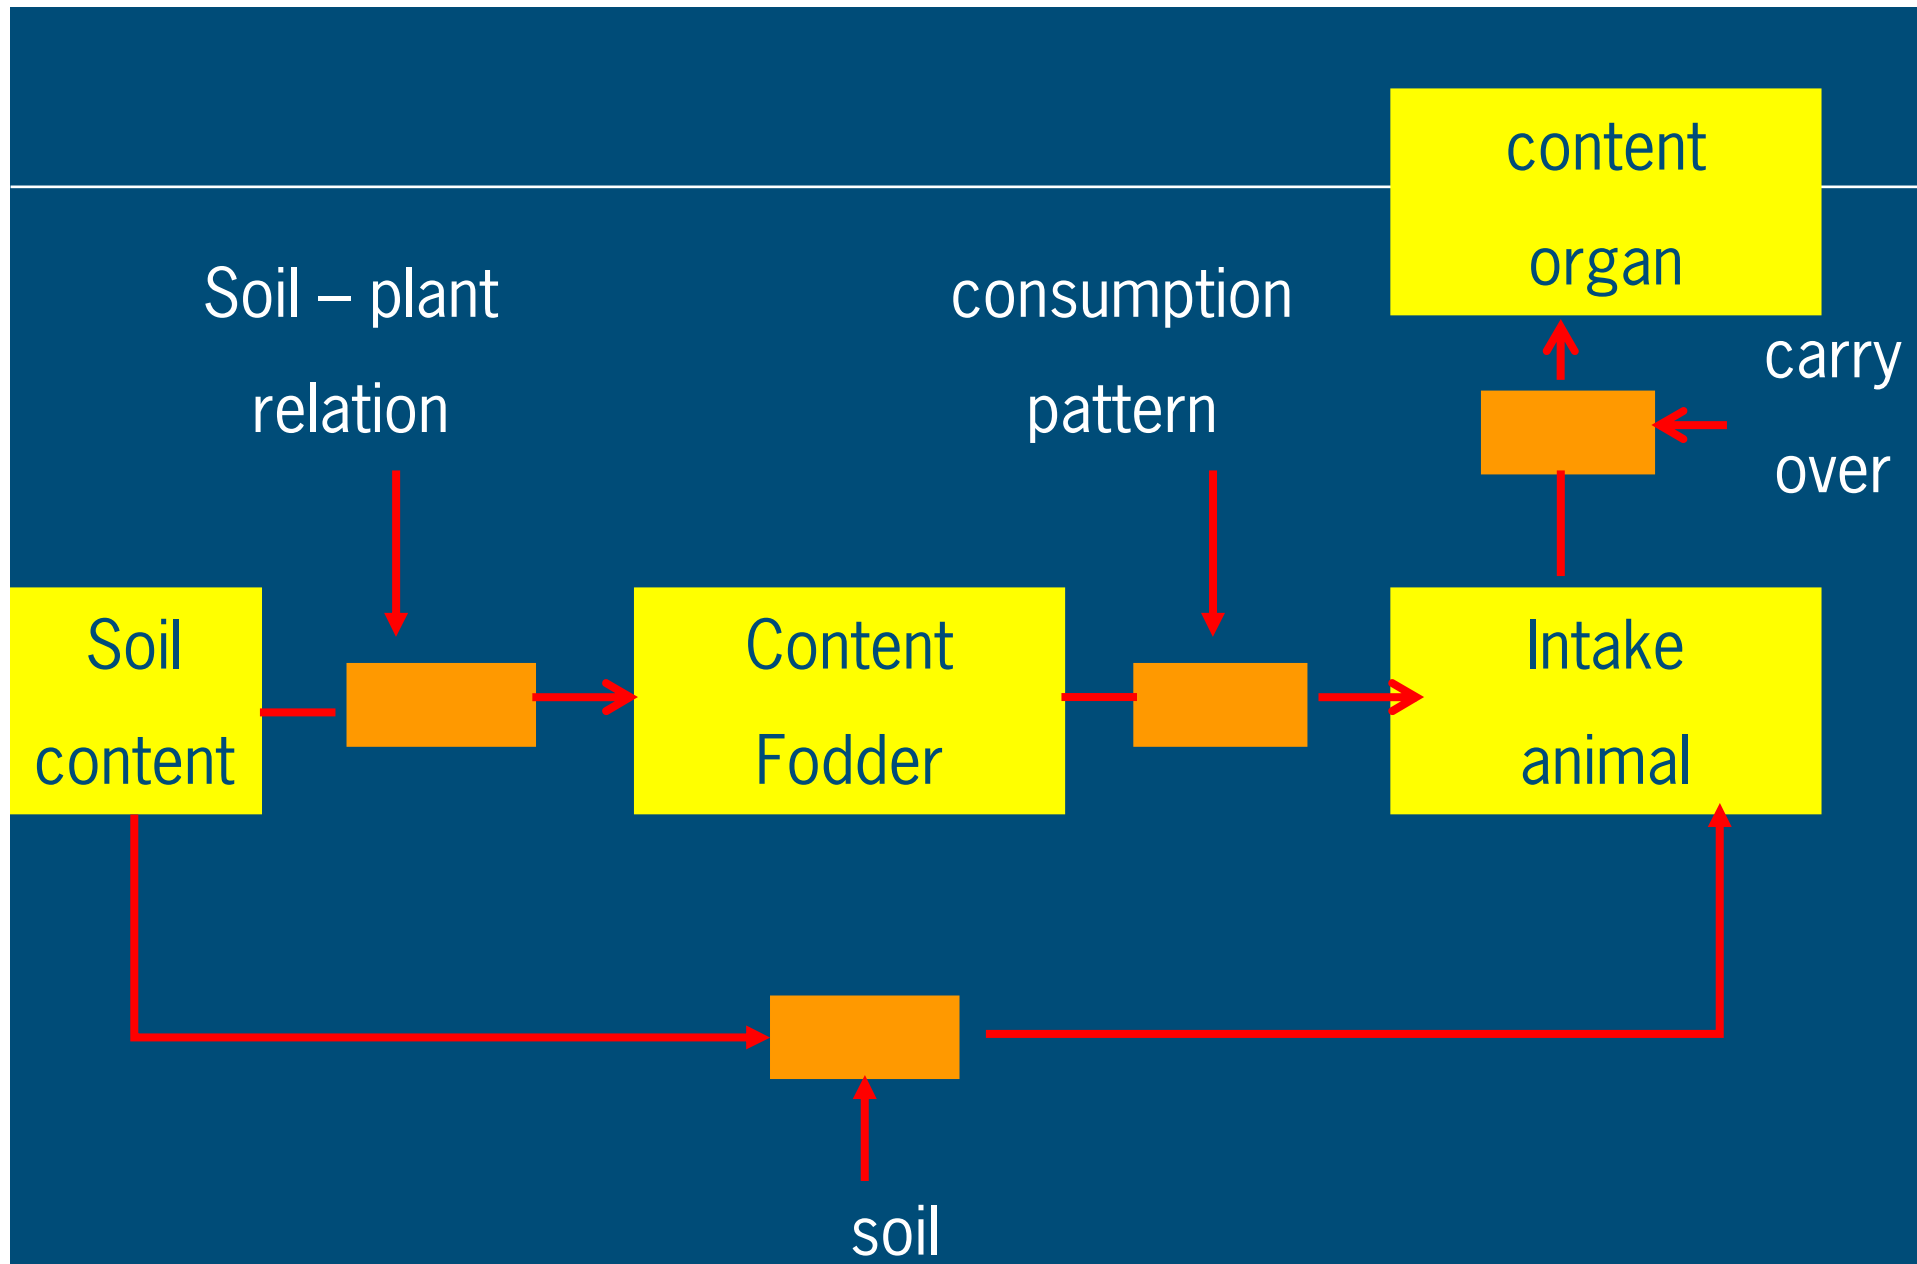

Chain model

Soil - animal

Critical concentration  
organ

Critical soil content

# Local Standards for Agriculture: examples

		Land Use					
		Arable Crops			Fodder production		
		sand	clay	peat	sand	clay	peat
Soil type:							
Arsenic	As	30	50	50	30	50	50
Cadmium	Cd	1	1	2	1	3	2
Chromium	Cr	100	180	140	100	180	140
Copper	Cu	50	160	200	50	80	80
Mercury	Hg	2	2	2	2	2	2
Lead	Pb	100	200	200	100	200	200
Nickel	Ni	15	50	60	15	50	60
Zinc	Zn	150	350	350	150	660	720

- Values must be higher or equal to Background values
- Values cannot exceed Intervention value
- Values in red changed
- Model calculated values sometime less strict than fixed values

# Internet tools

As of 2007, Internet based tools are available to calculate national/local maximal values

The screenshot displays the RiscotoolboxBodem.nl website interface. The main content area is titled "Risicotoolbox resultaten" and shows a summary of the calculation. The calculation type is "Berekenen potentiële risico's van een voorgestelde set Lokale Maximale Waarden". The soil function is "Landbouw (zonder boerderij en erf)".

**Belangrijk:** lees meer over de [status](#) van deze berekeningen

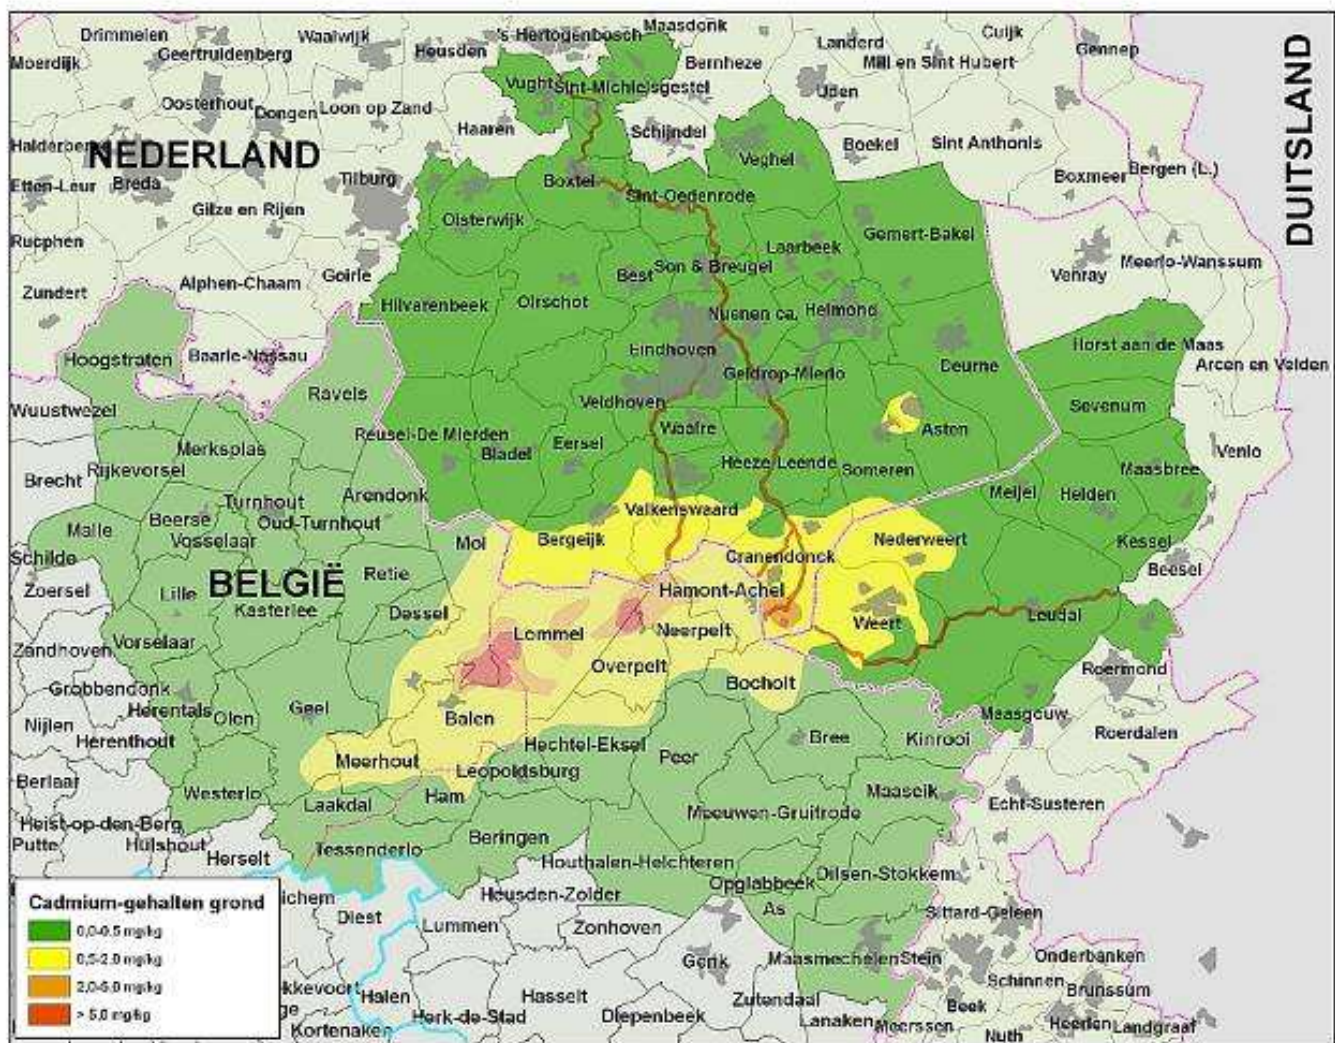

**Resultatenverkenner**

- Berekeningsresultaten
  - Ecologische risico's
    - Cadmium - Risico index: 6.3
  - Humane risico's
    - Cadmium, blootstellingsscenario: Landbouw, Risico index: 0.241
  - Landbouw risico's
    - Akkerbouw
      - Cadmium [RI = 3.8]
        - Cadmium in Aardappel [RI = 3.1]
        - Fytotoxiciteit van Cadmium voor Aardappel [RI = 0.3]
        - Cadmium in Gerst [RI = 1.7]
        - Cadmium in Tarwe [RI = 3.0]
        - Fytotoxiciteit van Cadmium voor Tarwe [RI = 0.2]
        - Toetsing Cadmium aan LAC waarde [klei] voor Akkerbouw [RI = 3.8]
      - Vollegrondsgroenteelt
        - Cadmium [RI = 3.4]
      - Akkerbouw voor veeteelt
        - Cadmium [RI = 3.2]
      - Veeteelt
        - Cadmium [RI = 9.7]
      - Fruittelt
        - Cadmium [RI = 3.8]

## Example 2: Kempen area

- Kempen Area (NL/B):
  - Input of Cadmium (and Zinc) to soil through thermal ore processing until mid-1970's
  - Affected area pm 350 km<sup>2</sup>
  - Soils: sandy, acid, low organic matter
  - High mobility and (bio)availability of cadmium in soil
  - Leaching to ground/surface water: impact on ecosystem
  - Intake by grazing animals: animal health/quality animal products
  - Uptake by crops: quality of arable crops
  - Exposure of human beings: health effects?

# The Kempen Area: cross border problem

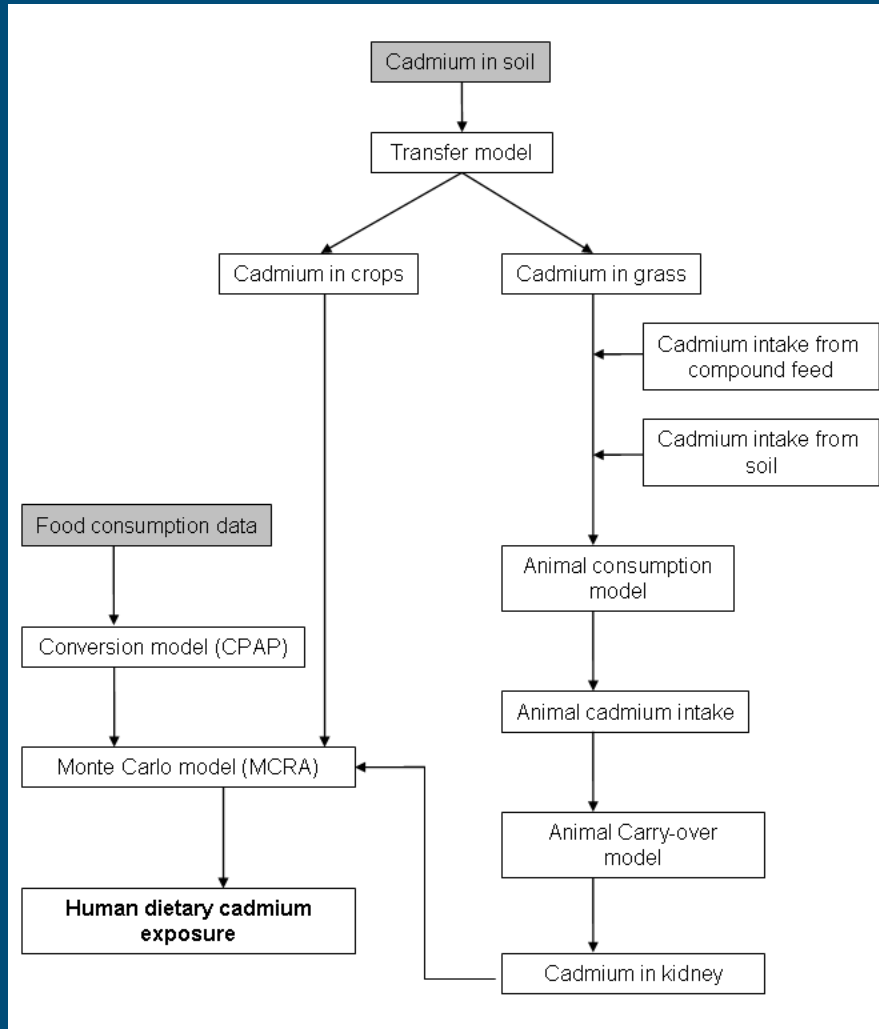

# The question

- What impact has cadmium in soil on exposure of cattle and humans?

# The Approach: chain model (from soil to salad)

1. Soil to Crop model (field data) by ALTEERRA
2. Animal Consumption Patterns by ASG
3. Animal Carry-over Model by RIVM
4. Food consumption and dietary exposure model by RIKILT

# Basic Needs

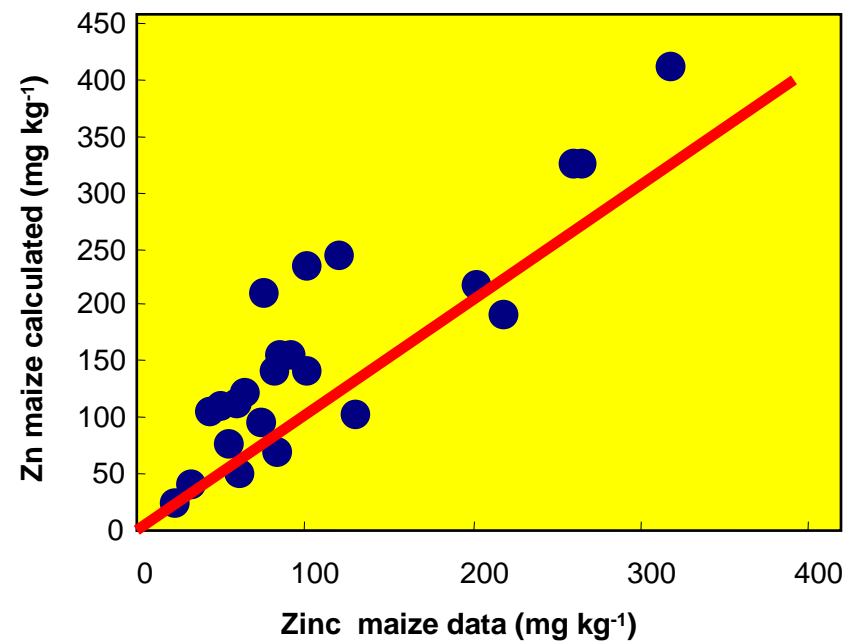

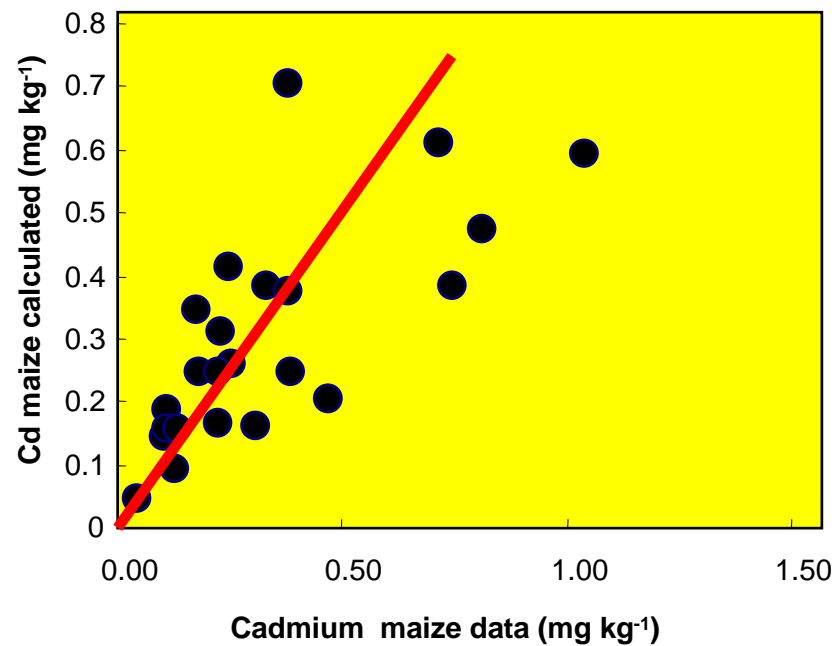

- Soil map: organic matter, pH, clay content
- Soil cadmium map
- Data on soil and crop quality: soil – plant model (field data!): fodder and arable products
- Data on consumption of cows of different age
- Data on levels of Cd in different animal products
- Data on average (and range in) consumption patterns of people

# Soil – Plant Model

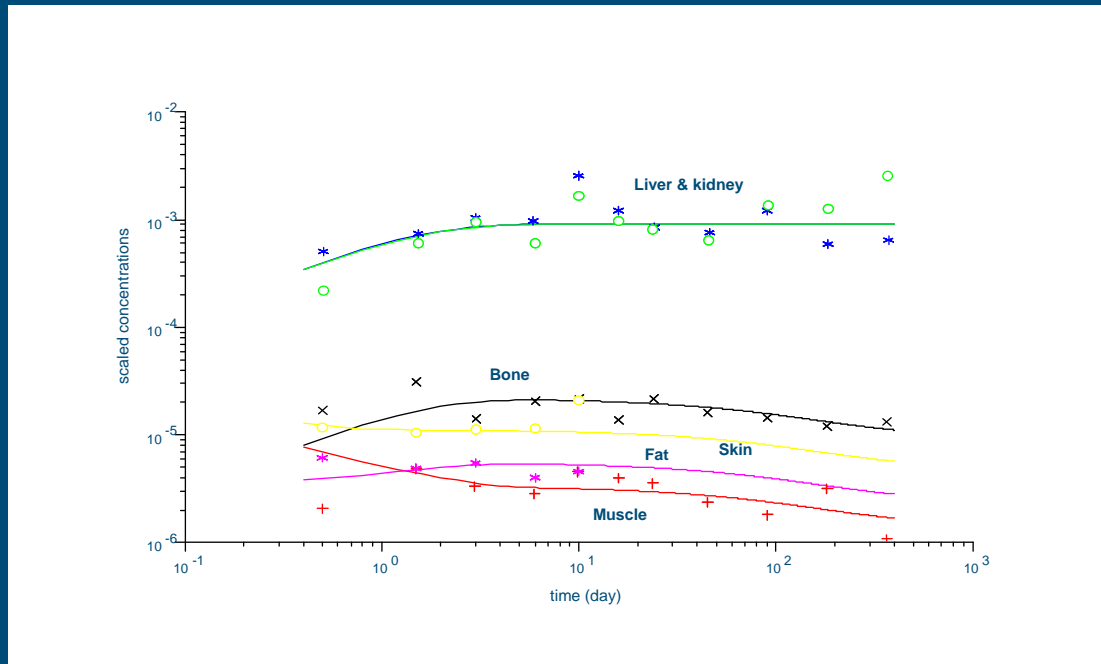

- Soil : plant
  - non-linear Freundlich-type model including effect of pH, organic matter and Cd-soil (Brus et al., 2005)
- $^{10}\log(\text{Cd-plant}) =$  INT
  - + a \* pH
  - + b \*  $^{10}\log[\text{Org Mat}]$
  - + c \*  $^{10}\log[\text{Cd-soil}]$
- Calibration based on field data

# Soil – Plant Model

Measured vs predicted levels of Cd and Zn in fodder

# Accumulation of Cadmium in kidneys

Model derivation:  
Beresford *et al.* (1999, 2001)

Model validation:  
Crout *et al.*, (2004)

## Conclusions:

1. No excretion (Cd) in kidney
2. Derivation of linear BTR
3. Short term study....

# Food Consumption and Exposure

- Based on 12500 measured food consumption patterns
- Intake based on MCRA (Monte Carlo Risk Assessment program version 6 (de Boer et al., 2007)).
- Variability distribution of short-term intakes
- The exposure was modeled for the total population (1-97 years, 36.3 years, 62.8 kg, n=6250) and for children (1-6 years, 3.6 years, 17.1 kg, n=530).

# Human Exposure: scenarios

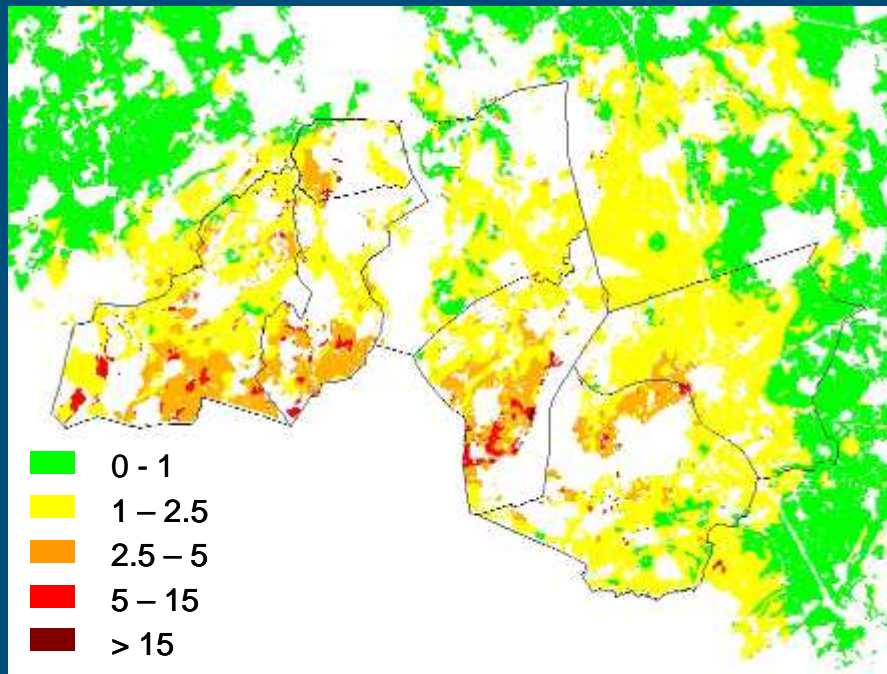

- A. NL scenario (average consumption from non-polluted areas)
- B. Kempen scenarios (100% consumption from Kempen)

Scenario	Cadmium level soil (mg kg <sup>-1</sup> )	pH	Description
1	0.5	4.5	Clean – low pH
2	0.5	5.5	Clean – high pH
3	1.0	4.5	Average – low pH
4	1.0	5.5	Average – high pH
5	2.5	4.5	Contaminated – low pH
6	2.5	5.5	Contaminated – low pH

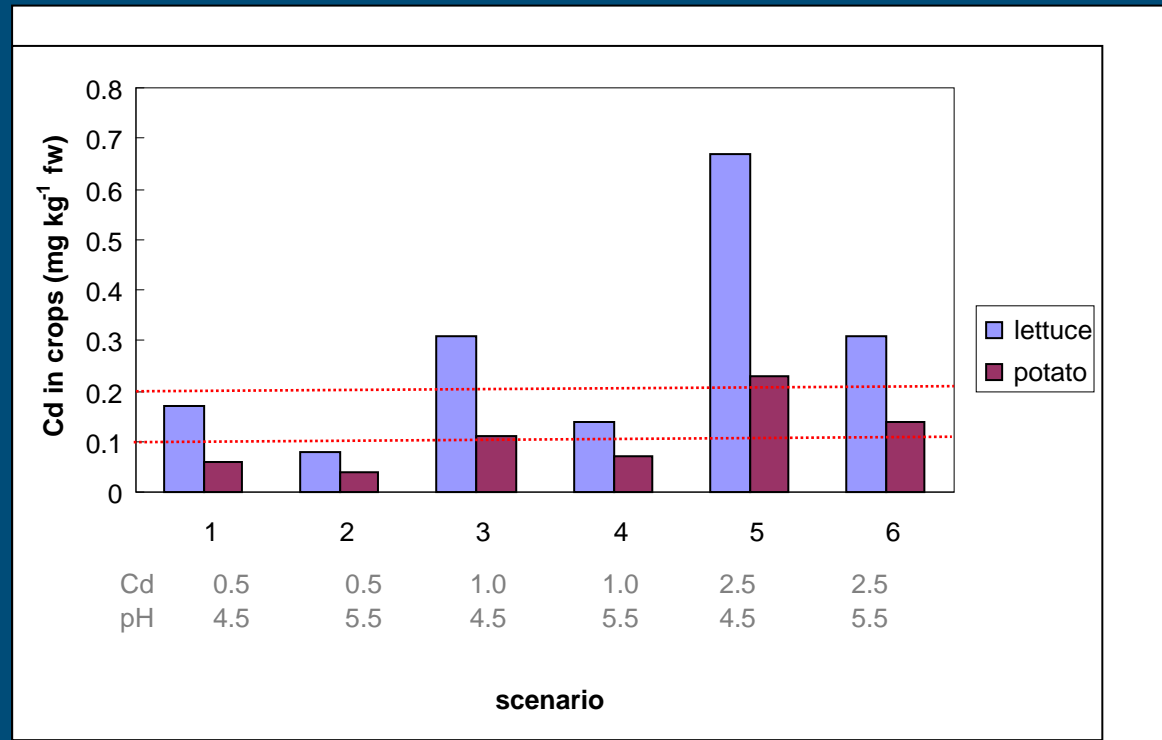

# Quality of organ meat in the Kempen area

Predicted Cadmium levels in kidneys of cows (6 yr)

Conclusion: Cd in organ meat exceeds acceptable level as set by EU regulations

# Quality of Arable products in scenarios

Quality of products like beans, cucumber is OK in all scenarios

# Human Exposure: Results

## ■ Contribution to exposure:

# Exposure: variability and distribution

Worst case scen.

Nat. monitoring data

1 – 97 yrs

< 6 yrs yrs

Source: Franz et al. (2008)

# Practical Solutions: Look-up Tables

Cd-Soil	pH						
	4	4.5	5	5.5	6	6.5	7
0.2	0.18	0.10	0.07	0.05	0.03	0.02	0.01
0.6	0.25	0.15	0.11	0.07	0.05	0.03	0.02
1.0	0.31	0.20	0.14	0.09	0.06	0.04	0.03
1.4	0.35	0.24	0.16	0.10	0.07	0.05	0.03
1.8	0.39	0.26	0.17	0.12	0.08	0.05	0.03
2.2	0.43	0.28	0.19	0.13	0.08	0.06	0.04
2.6	0.46	0.30	0.20	0.14	0.09	0.06	0.04
3.0	0.48	0.32	0.22	0.14	0.10	0.06	0.04

Example 1: Cd-soil 1.0, pH 4.5

**Quality insufficient**

Example 2: Cd-soil 3.0, pH 6.5

**Quality Sufficient**

# Conclusions (I)

- Chain model gives insight in impact of soil quality on exposure in food chain;
- Small additional exposure in Kempen area;
- Risk area (soils  $> 2$  ppm and  $\text{pH} < 5$ ) is small

## Conclusions (II)

- Measures to reduce risks relatively easy (increase soil pH);
- Advice not to grow lettuce, endive and celery in peoples gardens;
- Model approach can be easily adapted to local/regional conditions;
- Applicable on field level and regional/(inter)national level;
- Uncertainty in some model parts can be considerable (transfer into animal organs).

## Example 3: scenario studies metal balances

“in the **long term input of heavy metals resulting from applications of manure and fertilisers** must be balanced by the output, which is the amount leaving the system via crops and leaching to groundwater. The balance must be set in such a way that the ecological health of soil is maintained, **concentrations of substances in crop or animal products do meet standards for food safety** and **the flux to groundwater does not lead to pollution of ground- and surface water**”

Source: REPORTS OF THE TECHNICAL WORKING GROUPS ESTABLISHED UNDER THE THEMATIC STRATEGY FOR SOIL PROTECTION VOLUME – IV CONTAMINATION AND LAND MANAGEMENT

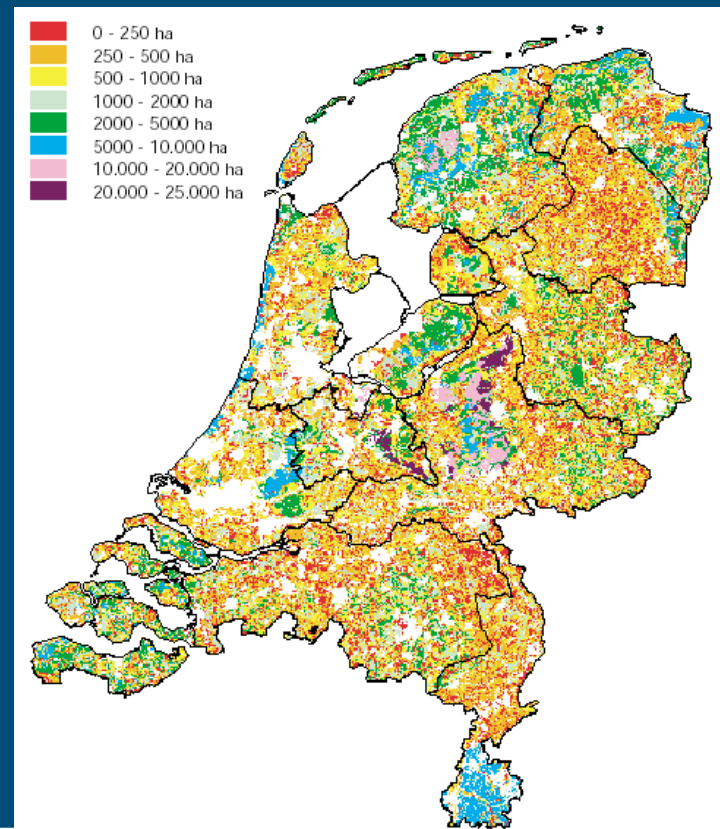

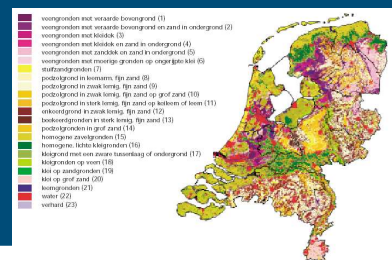

Inputs: fertilizers, manure,  
atmospheric deposition,  
sludge  
deposite)

Yield crops

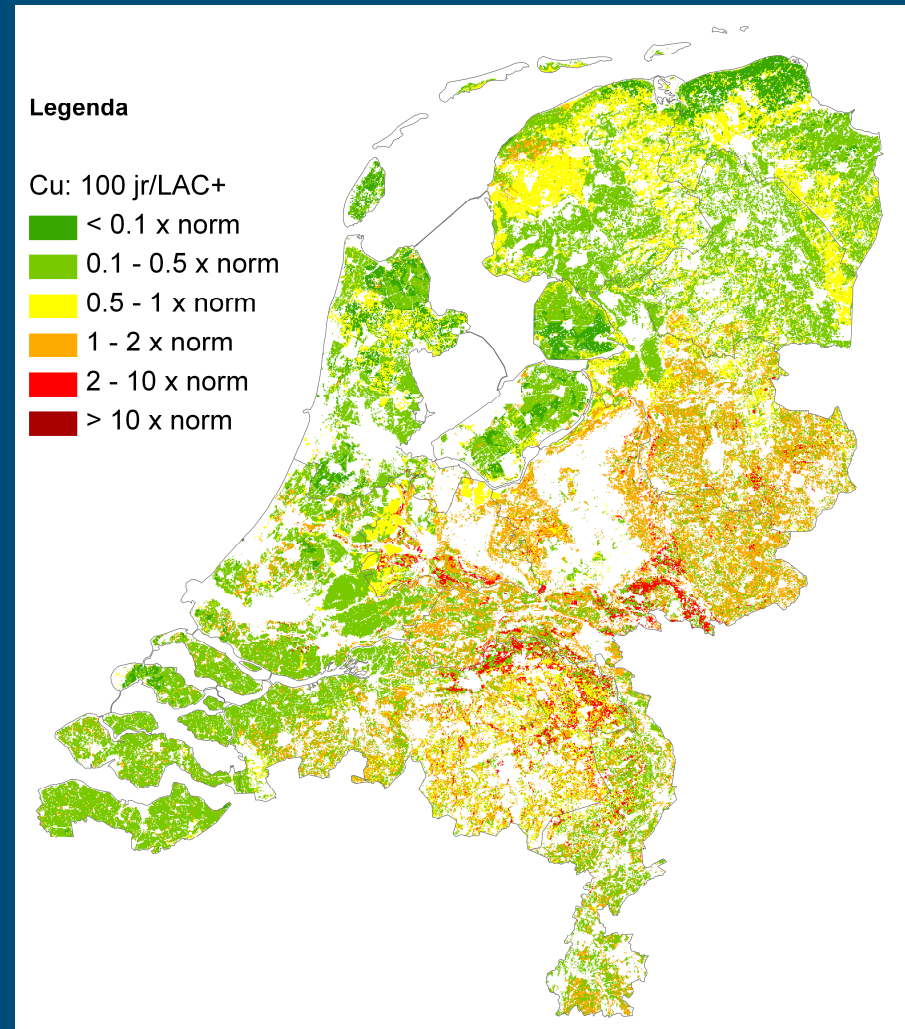

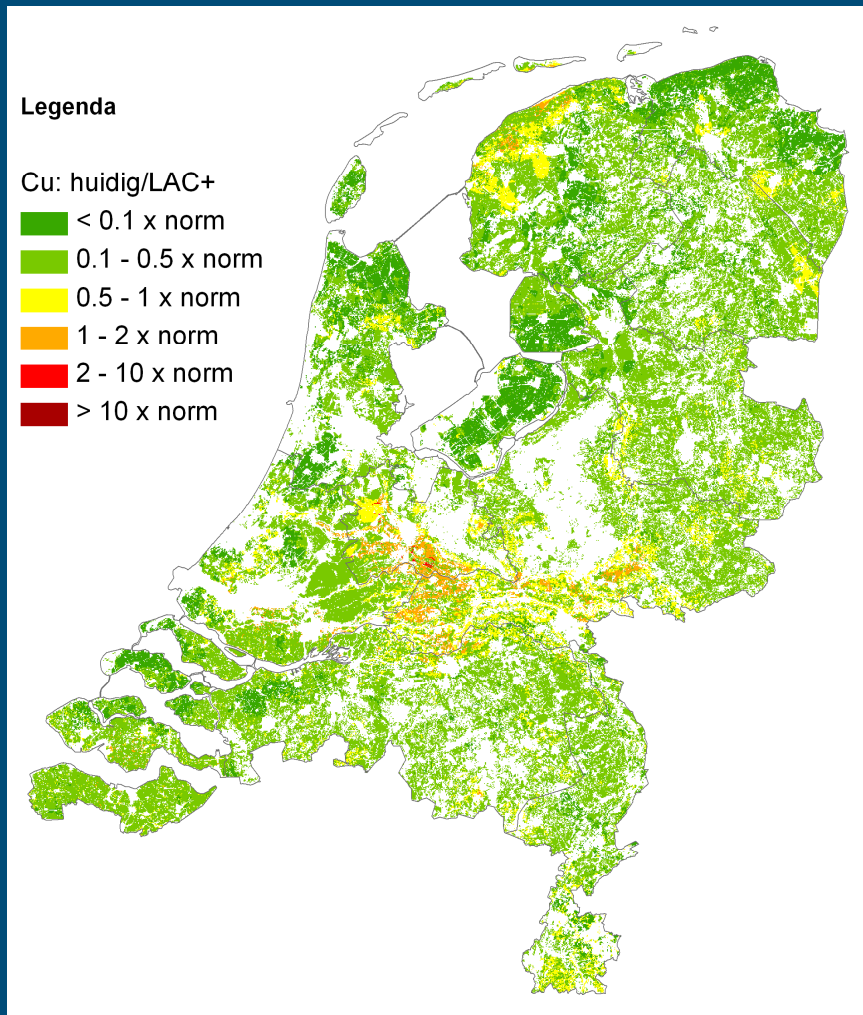

# Regional scale

Netherlands in 6405 unique units: combinations of soil type, hydrology and land use

# scenario studies

- Framework can be used from local to national scale
- Concept is general applicable (not country specific)
- EU: harmonisation of concepts rather than harmonisation of standards
